

## Piezoelectric Travelling Wave Ultrasonic Motors based on the Shear Effect with Radially Polarised Annular Stator

Filesize: 3.24 MB

### **Reviews**

*The publication is not difficult in go through better to comprehend. I could comprehended everything using this created e publication. Its been designed in an exceptionally easy way in fact it is merely soon after i finished reading through this ebook by which basically transformed me, modify the way i really believe.*

Shaker Verlag Okt 2011, 2011. Buch. Book Condition: Neu. Neuware - The present thesis is concerned with the mathematical-analytical model of a piezoelectric travelling wave ultrasonic motor (USM) based on the shear effect. USMs have been adopted in high precision applications such as in the robotics, automotive industry, medical devices and autofocus of camera lenses. They are characterised by compact size, low speed with high torque and zero backlash. Since the shear piezoelectric coupling factor and the shear piezoelectric constant are higher than for the other piezoelectric effects, a relative higher torque and a better efficiency are also attained. In this thesis, special attention is paid to the kinematics and the geometry of the motor parts and to characteristics that influence efficiency and torque. In the motor, the stator is of disc-type, made of piezoceramics and radially polarised. It is therefore modelled as an annular Reissner-Mindlin plate with piezoelectric terms. Rayleigh-Ritz discretisation is used to obtain eigenfrequencies and eigenmodes of the stator plate. In the laboratory, measured eigenfrequencies of the free vibrations of the plate corroborate the numerical method. Particularly, the generation of travelling waves requests the excitation of two degenerated vibration modes. This requires a specific electrode configuration and, in this case, the design of a voltage inverter. A suitable vibration mode is chosen as working mode for the motor, so that the energy loss through friction in the radial direction is minimised. The transmission of load from stator to rotor occurs through a ring of teeth over the stator. Instead of just estimating the influence of the teeth on the stator model, the kinetic energy of the teeth set is formulated and taken into account in the equations of motion. Additionally, the conditions for the symmetry of the stator are stated with respect to the disposition and the...
